

Population Trends Over 10 Years in the Africa Region

For our project, we took data from the World Bank and UNHCR and studied the displacement effects on the African population from 2009 to 2019.

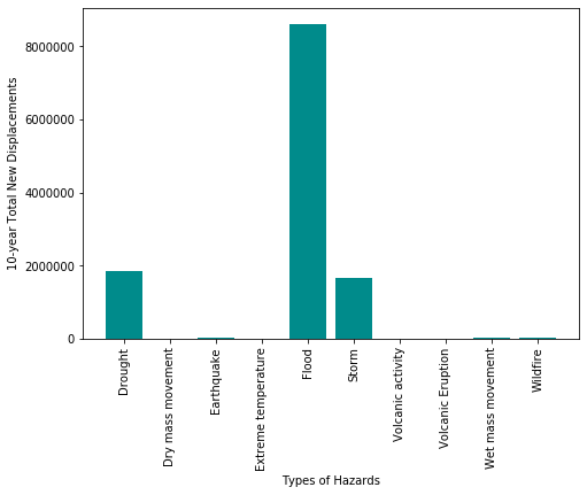

New Disaster Displacement by Country

By looking at a 10 year analysis, we took the following 5 countries with the greatest single year displacements and measured their population changes. On this visualzation you will see the 10 year displacement effect.

Displacement Causes

After assessing the data, we reviewed which displacements impacted the region the most over the 10 year time period. In this graph, the majority of population displacement is caused by Flood.

Conflict vs Disaster

During our review, we also wanted to see how disaster versus conflict impacted the population numbers over the 10 year time frame.
